U.S. Patent and Trademark Office PTO-326 (Rev. 04-01) Art Unit: 1771

DETAILED ACTION

Specification

1. The disclosure is objected to because of the following informalities: At the beginning of the Specification (page 1) under the heading "Cross Reference To Related Applications", the continuity data needs to be updated as Application 09/335,257 has matured into USP 6,117,365. Appropriate correction is required.

Claim Objections

2. Claim 19 is objected to because of the following informalities: it appears that the phrase "an elastomer possessing" has been typed twice. Please delete the redundant phrase. Appropriate correction is required. This claim is being interpreted as "the airbag of claim 13, wherein said coating comprises an elastomer possessing a tensile strength of at least 1,500 psi". Additionally, the "p" in "Psi" should not be capitalized.

Claim Rejections - 35 USC § 112

- 3. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 4. Regarding claims 1-19, the phrase "side impact curtain-*type*" renders the claims indefinite because the claims include elements not actually disclosed (those encompassed by "type"), thereby rendering the scope of the claim(s) unascertainable. See MPEP § 2173.05(d). Applicant may just refer to airbag as a side impact airbag, which is common U.S. terminology.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

Art Unit: 1771

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) do not apply to the examination of this application as the application being examined was not (1) filed on or after November 29, 2000, or (2) voluntarily published under 35 U.S.C. 122(b). Therefore, this application is examined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

- 6. Claims 1, 9 & 10 are rejected under 35 U.S.C. 102(e) as being anticipated by VEIGA et al (USPN 6,239,046).
- 7. Applicant's claim 1 is drawn to a side impact airbag to which a two-layered coating system is applied, wherein at least one of the said layers comprises polyurethane. Claim 9 further limits claim 1 to where at least one layer of the polyurethane coating is applied to said airbag in an add-on weight of from about 0.3 to 2.5 ounces/square on each side of the cushion. Claim 10 further limits claim one wherein at least one layer of coating comprising polyurethane is applied to said airbag in an add-on weight of from about 0.6 to about 1.5 ounces/square yard.
- 8. Veiga et al. teach a coated textile fabric for use in an airbag (air curtain-column .1, line 28 & column 2, line 34, which is also synonymous in the art as a side curtain, as it is positioned laterally to the occupant) having a plurality of polymeric layers coated thereto (column 1, lines 5-10). The fabric, being a woven, knit or nonwoven textile is first coated with a polyurethane layer, which is then coated with a layer of elastomeric polysiloxane (column 1, lines 50-55). The polyurethane coating weight applied is about 0.3-ounces/square yard to about 1.5-ounces/square yard with 0.5-ounces/square yard preferred (column 1, lines 57-59). In an alternative

Art Unit: 1771

embodiment as shown in column 3, lines 39-50, the fabric may be coated on both sides with a polyurethane coating which is similar in its composition and physical properties to the first polyurethane layer. With regard to Applicant's claim 9, the required coating of both the polyurethane layers at the most would add up to 1.5 ounces per sq. yd + 0.5 oz. per sq. yd =2.0 oz. per sq. yd (Patent Claims 22 & 23). Thus, Veiga et al. teach a side impact air bag having at least one layer of a polyurethane coating wherein the coating has an add-on weight of at least 0.3 to a bout 2.5 ounces/ square yard. The composite may be laminated on both sides with polyurethane coatings. Therefore, the cited Veiga et al patent anticipates Applicant's Claims 1, 9 & 10.

- 9. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- Claims 2-4, 8, & 12; 16-18 are rejected under 35 U.S.C. 102(e) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over VEIGA et al (USPN 6,239,046). Veiga et al. disclose what is set forth above, however Veiga et al. fail to disclose or do not explicitly teach the claimed airbag having "a peak initial pressure of 30 psi through utilization of 6.7 liter compresses nitrogen gas tank, a pressure retention of at least 1 or 6 psi at 10 seconds subsequent to inflation and tensile strength, it is reasonable to presume that the said featured property is inherent to Veiga et al. Support for said presumption is found in the use of like materials i.e. a side airbag coated with polyurethane coating system having an add-on weight of at most 3.0 oz/yd², which would result in having this property. The burden is shifted to Applicant to prove otherwise. In re Fitzgerald 205 USPQ 495. Alternatively, the

Art Unit: 1771

presently claimed property of an airbag having a peak initial pressure of 30 psi through utilization of 6.7 liter compresses nitrogen gas tank, having a pressure retention of at least 1 or 6 psi at 10 seconds subsequent to inflation would obviously have been present, along with the tensile strength, once the Veiga product was provided. See In re Best, 195 USPQ 433.

Allowable Subject Matter

- 11. Claims 5-7,11,13-15 &19 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, second paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims. Prior to Applicant's effective filing date (06/17/99), there was no prior art found that teaches or fairly suggests the use of a jacquard wovens as a fabric layer in airbags. At the time the invention was conceived the most commonly known weaving configurations were plain, basket or twill. Although, Veiga et al. disclose that any weaving configuration can be employed (column 2, line 28) there is no motivation to use a decorative fabric, such as a jacquard woven, which is more expensive to produce than the plain, basket or twill fabric
- 12. With respect to Claims 13-15, though Veiga et al. appears to be the closest prior art at this time, Veiga requires a polysiloxane layer atop at least one of the polyurethane layers and thus the laminate would not be silicone -free.

Conclusion

- 13. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
 - USPN 6,169,043 to Li & 6,177,365 both disclose the use of jacquard wovens as an airbag fabric, but fails to meet Applicant's effective filing date and thus are not available as references.
